What is RMarkdown?

Markdown = Language for text formatting - Markdown - an easy to write plain text format for creating dynamic documents and reports - contains “normal” text and code chunks (e.g. R, but Python, SQL, and more also possible) - RMD -> MD -> html, Docx or PDF - Formatting documents outside the analysis

Creating a document that can contain both text and code: - When creating (“knitting”), the code is executed and displayed together with the description. - Only a document without warnings/errors can be knitted. - Possible to export a Word, HTML or PDF file.
